The chlorophyll detector is based on the absorption of the chloroplast pigment extract to the visible spectrum, and uses a spectrophotometer to measure its absorbance at a specific wavelength, and the formula can be used to calculate the content of each pigment in the extract. According to the Lambert-Beer law, the absorbance  $A$  of a colored solution is proportional to the solute concentration  $C$  and the liquid layer thickness  $L$ , that is,  $A = \epsilon CL$  where:  $\epsilon$  proportionality constant.
