The global Portable Formaldehyde Tester market size is predicted to grow from US\$ 120 million in 2025 to US\$ 154 million in 2031; it is expected to grow at a CAGR of 4.3% from 2025 to 2031.

A Portable Formaldehyde Tester is a handheld or compact device designed to measure the concentration of formaldehyde (HCHO) gas in the air. Formaldehyde is a colorless, strong-smelling chemical compound commonly found in various indoor environments, including homes, offices, and industrial settings. It is often used in the production of building materials, household products, and some industrial processes. Monitoring formaldehyde levels is important because prolonged exposure to elevated levels can pose health risks, including respiratory and eye irritation and, in some cases, carcinogenic effects.

Manufacturers are continually improving the sensing technology used in Portable Formaldehyde Testers. This includes the development of more sensitive and selective sensors, such as advanced electrochemical sensors, metal oxide sensors, and photoionization detectors (PID), to provide accurate and reliable measurements.
