The global Portable Gas Chromatograph Mass Spectrometer (GC/MS) market size is predicted to grow from US\$ 443 million in 2025 to US\$ 1077 million in 2031; it is expected to grow at a CAGR of 15.9% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Portable GC-MS technology is a derivative and development of traditional GC-MS technology. In terms of instrument stability and accuracy, portable GC-MS technology is basically at the same level as desktop laboratory GC-MS technology, and can meet the detection needs of on-site analysis. Some fixed pollution sources have the characteristics of intermittent emissions due to process reasons. At present, in the daily supervisory monitoring of pollution sources, in order to obtain the true situation of pollution source emissions, enterprises must actively cooperate and conduct multiple sampling under normal operating conditions, or use weighted average time sampling. The on-site analysis method has strong real-time performance, which can effectively shorten the time from 'sampling to result output' and improve analysis efficiency. The on-site analysis method provides a new solution for supervisory monitoring of pollution sources. Real-time continuous sampling and analysis not only reduces the workload of personnel and reduces the intervention of pollutant-discharging enterprises, but also effectively monitors the changes in emission concentrations of pollutants from pollution sources and the instantaneous emission peaks.
