The global Portable Lying Hyperbaric Chamber market size is predicted to grow from US\$ 137 million in 2025 to US\$ 205 million in 2032; it is expected to grow at a CAGR of 5.8% from 2026 to 2032.

Portable Lying Hyperbaric Chamber is a lightweight, movable hyperbaric therapy device designed for users to receive treatment in a lying posture. Constructed mainly with flexible airtight materials, it is fitted with an air compression unit, pressure regulator and safety protection components. By building up stable positive pressure inside the sealed cabin, it elevates the partial pressure of inhaled oxygen, boosts oxygen delivery to body tissues and cells, and helps relieve physical fatigue, accelerate post-exercise recovery and assist daily health conditioning. Featuring compact structure, easy transportation and simple operation, this equipment is widely applied in household health care, sports venues and beauty and wellness institutions.

In 2025, global Portable Lying Hyperbaric Chamber production reached approximately 16,279 units, with an average global market price of around US\$ 8,600 per unit. The production capacity of Portable Lying Hyperbaric Chamber is approximately 20 K units per year, the average gross profit margin was 28-31%.

The upstream supply chain for portable lying hyperbaric chambers consists of raw material suppliers providing medical-grade flexible fabrics (such as reinforced TPU or nylon), specialized sealing components, pressure-control valves, oxygen concentrators/compressors, monitoring sensors, and control electronics, alongside providers of safety certification and testing services that ensure compliance with medical and pressure vessel standards. These components are sourced based on strict criteria for reliability, pressure tolerance, and biocompatibility, then assembled by

manufacturers who integrate systems, conduct leak and pressure testing, and program control logic. Downstream, the chambers move through distribution channels including medical equipment suppliers, wellness product distributors, e-commerce platforms, and direct-to-consumer sales, reaching end-users such as home users, sports recovery centers, private clinics, and wellness facilities, with additional support services for installation, training, maintenance, and calibration provided by specialized service providers.

The cost structure of a portable lying hyperbaric chamber is dominated by material costs for the flexible chamber enclosure (typically 25-35% of total cost), followed by the oxygen delivery system (concentrator/compressor, 20-30%), control and monitoring components (sensors, valves, electronics, 15-20%), and labor costs for precision assembly, welding, and testing (10-15%). Additional costs include research and development for safety features and ergonomic design, regulatory compliance and certification fees (5-10%), packaging and logistics, marketing expenses, and overhead costs such as facility operations and quality control.
