The global Portable Magnetic Particle Inspection Units market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

Magnetic particle inspection (MPI) is a nondestructive testing method used for defect detection.

MPI uses magnetic fields and small magnetic particles (i.e. iron filings) to detect flaws in components. The only requirement from an inspectability standpoint is that the component being inspected must be made of a ferromagnetic material such as iron, nickel, cobalt, or some of their alloys. Ferromagnetic materials are materials that can be magnetized to a level that will allow the inspection to be effective.

Portable magnetic particle inspection units (Portable MPI Units) can be used for a wide variety of applications to quickly and reliably detect surface and near surface discontinuities in both circular and longitudinal modes. Because of their small size and light weight, the Portable MPI Units can be easily transported by one person to the inspection site. This compact feature is particularly valuable in limited access areas, such as those found on ships, bridges, pipeline, aircraft, petro chemical plants as well as other close quarter applications.

United States market for Portable Magnetic Particle Inspection Units is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
