The global Portable Radiography Acquisition System market size is projected to grow from US\$ million in 2022 to US\$ million in 2029; it is expected to grow at a CAGR of % from 2023 to 2029.

The major consumer markets for Portable Radiography Acquisition Systems are North America and Asia Pacific. With the gradual recovery of the global economy after the COVID-19 outbreak and the return of major economies to normal, the medical industry will see certain growth. As global medical standards continue to improve, more and more hospitals and clinics are able to perform radiology examinations. As a result, the demand for Portable Radiography Acquisition Systems will grow in the foreseeable future.

A Portable Radiography Acquisition System is a medical imaging device that allows for the acquisition of X-ray images using a portable, handheld device. This system consists of a portable X-ray generator, a digital detector panel, and an image processing unit. The portable X-ray generator emits X-rays that penetrate the patient's body and are detected by the digital detector panel. The digital detector panel converts the X-rays into digital signals, which are then transmitted to the image processing unit. The image processing unit processes the digital signals and produces high-quality X-ray images that can be viewed on a computer or other display device. Portable radiography systems are typically used in emergency rooms, intensive care units, and other clinical settings where it may not be possible to move patients to a dedicated X-ray room. They are also commonly used in veterinary clinics and field hospitals where mobility and flexibility are important factors. Portable radiography acquisition systems offer several advantages

over traditional X-ray systems, including improved portability, faster image acquisition times, and reduced radiation exposure for both patients and healthcare professionals.
