The global Portable Retina Camera market size is predicted to grow from US\$ 456 million in 2025 to US\$ 629 million in 2031; it is expected to grow at a CAGR of 5.5% from 2025 to 2031.

The retinal camera mainly uses coaxial illumination to illuminate the fundus of the eye through the pupil. Light of different wavelengths can focus on different tissues of the fundus; through the lens set and photosensitive devices (CCD, CMOS), images of the retina, choroid, etc. , transmitted to the computer image processing system, which records and saves the captured fundus image information.

With the increasing number of mobile eye care facilities and ophthalmology clinics, as well as the installation of fundus cameras, the retinal imaging equipment market is expected to gradually grow.
