The global Portable Ultraviolet Flue Gas Analyzer market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The portable UV flue gas analyzer is a high-precision measuring instrument that integrates UV spectroscopy analysis technology, chemometric algorithms and modern electronic technology. It uses ultraviolet light as an excitation light source, and monitors the absorption and scattering characteristics of ultraviolet light by substances in the flue gas to quantitatively or qualitatively analyze particulate matter (such as smoke, dust), gaseous pollutants (such as SO₂, NO, NO₂, O₂, CO, CO₂, etc.) and other possible compounds in the flue gas.

The technical principle of the portable UV flue gas analyzer is mainly based on ultraviolet spectroscopy analysis technology. When ultraviolet light passes through the tested flue gas, the substances in the flue gas absorb or scatter part of the ultraviolet light. The instrument can calculate the concentration of various components in the flue gas by monitoring the changes in these light signals and combining chemometric algorithms. Among them, light scattering detection is mainly used for the measurement of particulate matter, while light absorption detection is used for the measurement of gaseous pollutants.
