The demand for Positive Displacement Microdispensing Valves is continuously rising with the growth in electronic manufacturing and precision engineering requirements. Business opportunities lie in technological innovation and the provision of customized solutions to meet the high-precision dispensing needs of various industries.

Positive Displacement Microdispensing Valves are designed to deliver precise, consistent, and repeatable volumes of fluids at the micro-liter scale, utilizing a mechanism that ensures each dispense is an exact, pre-measured amount. The valves are engineered with high-accuracy components to minimize variability in flow rate and volume, making them ideal for applications requiring tight control over the quantity of dispensed material. These valves operate by trapping and displacing a fixed volume of

fluid with each actuation, which is particularly useful for dispensing viscosities that are sensitive to pressure variations, ensuring uniformity and reliability in the dispense process.
