The global Positive Electrode Lithium Supplement market size is predicted to grow from US\$ 426 million in 2025 to US\$ 10150 million in 2032; it is expected to grow at a CAGR of 58.4% from 2026 to 2032.

Positive electrode lithium supplement refers to a material used to supplement lithium ions on the surface of positive electrode materials of lithium-ion batteries. Positive electrode materials are the key part of lithium-ion batteries that store and release lithium ions, and positive electrode lithium supplements can supplement lithium ions on the surface of positive electrode materials to improve the capacity and performance of batteries. During the charge and discharge process of lithium-ion batteries, lithium ions will be deintercalated and embedded in positive electrode materials, which determines the capacity and performance of batteries. However, after long-term use, positive electrode materials may lose or become unstable, resulting in a decrease in battery capacity. Positive electrode lithium supplements can repair the structure of positive electrode materials and improve the capacity and cycle life of batteries by supplementing lithium ions.

Positive electrode lithium supplements have broad application prospects in the field of lithium-ion batteries. It can improve the cycle performance, calendar life and energy density of various types of lithium-ion batteries, and can effectively improve the energy efficiency of battery cells, improve low temperature performance, improve fast charging performance, and reduce battery self-discharge. In addition, the operation of positive electrode lithium supplements is simple, the process is simple, and there is no need to change the production line structure. It only needs to add lithium supplements in the positive electrode slurry mixing link.

With the rapid development of new energy vehicles, energy storage systems and other fields, the demand for high-performance lithium-ion batteries continues to grow. As one of the key materials for improving the performance of lithium-ion batteries, the market demand for positive electrode lithium supplements has also increased.

The preparation technology of positive electrode lithium supplements has been continuously improved and innovated, which has improved its performance and stability. For example, by optimizing the preparation process and formula, the lithium supplement efficiency and cycle performance of positive electrode lithium supplements can be improved, thereby meeting higher requirements for battery applications.

The coordinated development of the lithium-ion battery industry chain has promoted the development of positive electrode lithium supplements. As an important link in the lithium-ion battery industry chain, the close cooperation between positive electrode lithium supplements and upstream and downstream enterprises helps to improve the technical level and market competitiveness of the entire industry chain.

With the improvement of environmental awareness, the environmental protection requirements for lithium-ion batteries are also getting higher and higher. As an environmentally friendly material, the application of positive electrode lithium supplements helps to reduce pollution and waste generation in the battery production process, which is in line with the concept of sustainable development.

At present, there are still some technical bottlenecks in the preparation process, performance stability and other aspects of positive electrode lithium supplements. For example, how to further improve the lithium supplement efficiency, reduce production costs, and improve the batch stability of products are all problems that need to be solved at present.
