Positive and negative pressure poultry isolators are specialized fences used in the poultry industry to protect birds from infectious diseases and maintain a sterile

environment for research purposes. These isolators aim to provide a controlled environment for poultry, enabling researchers and veterinarians to study and treat birds without any risk of contamination. Positive pressure poultry isolators use a fan and filter system to generate positive airflow inside the casing. This means that the air is constantly pushed out of the isolator to prevent any pollutants from entering. Positive pressure isolators are commonly used for research purposes, where maintaining a sterile environment is crucial. On the other hand, negative pressure poultry isolators use a fan and filter system to generate negative airflow inside the casing. This means that the air is constantly sucked into the isolator to prevent any pollutants from escaping. Negative pressure isolators are commonly used for clinical purposes, such as treating sick or infected birds. Both positive and negative pressure poultry isolators aim to provide a controlled environment for poultry, enabling researchers and veterinarians to study and treat birds without the risk of contamination. Isolators are usually made of materials that are easy to clean and disinfect, and may include functions such as HEPA filters to remove pollutants from the air.
