The research report highlights the growth potential of the global Positive Pressure Helium Detector market. With recovery from influence of COVID-19 and the Russia-Ukraine War, Positive Pressure Helium Detector are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Positive Pressure Helium Detector. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Positive Pressure Helium Detector market.

Positive pressure helium testing machine is a testing equipment used in the lithium-ion battery industry, mainly used to test the sealing performance of batteries. Lithium ion batteries need to be sealed during the production process to ensure that the electrolyte inside the battery does not leak, and to prevent external oxygen from entering the battery, thereby ensuring the safety and performance of the battery. The positive pressure helium detector tests the sealing performance of the battery by placing it in a sealed testing chamber and injecting a certain pressure of helium gas, using the low permeability and high sensitivity of helium gas. If the sealing performance of the battery

is good, helium will not leak or penetrate into the interior of the battery; If there is a problem with the sealing performance of the battery, helium gas will leak or penetrate into the interior of the battery, which will be detected by the testing equipment. The positive pressure helium detector can evaluate the sealing performance of batteries by detecting parameters such as helium leakage rate and permeability, and screen and eliminate unqualified batteries. This can ensure that the produced lithium-ion batteries have good sealing performance, improving the safety and reliability of the batteries.
