A positive progressing cavity pump is a type of positive displacement pump that efficiently handles a variety of fluids, ranging from low to highly viscous, as well as fluids containing solids. It operates through a helical rotor that rotates within a helical stator, creating a series of sealed cavities that move fluid continuously and smoothly from the inlet to the outlet. This design allows for precise control of flow rates, minimal pulsation, and the ability to handle shear-sensitive materials without degradation. Positive progressing cavity pumps are widely used in industries such as wastewater treatment, food and beverage processing, oil and gas, and chemical manufacturing, where their reliability and versatility in managing challenging pumping applications are highly valued.

The global Positive Progressing Cavity Pump market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
