Positively charged glass slides are a special type of glass slides with a positive charge on their surface after special treatment. Positively charged glass slides apply positive charges on their surface and use the principle of mutual attraction between positive and negative charges to firmly adsorb samples such as cells and tissue sections on the glass slide. This adsorption is not only stable, but also can maintain the morphological and structural characteristics of the sample, which is convenient for subsequent observation, staining and analysis. The positive charge on the surface of positively charged slides is permanent and denser, with stable performance, long shelf life, and better adhesion to histological and cytological samples. Positively charged slides are suitable for many fields such as pathological tissue sections and immunohistochemistry, and are particularly suitable for the preparation process that requires high temperature (above 80°C). In addition, to meet different needs, positively charged slides can provide writing surfaces in a variety of colors, such as orange, yellow, green, pink, blue, etc.

The global Positively Charged Slide market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
