Post-emergent herbicides are a type of chemical herbicide that is applied after weeds emerge and grow. They are used to kill weeds that have already germinated and are visible. They are often used for weed management in crop fields, gardening land, and non-cultivated areas. They are absorbed into the plant body through the leaves, interfering with the photosynthesis, protein synthesis, or hormone regulation system of the weeds, and ultimately leading to plant death. According to different selectivity, post-emergence herbicides can be divided into selective (killing only weeds without harming crops) and non-selective (toxic to all plants). Common active ingredients include glyphosate, paraquat, and 2,4-D.
