Post-Tensioning Bars are high-strength steel bars used in concrete structures to enhance their load-bearing capacity and structural performance. Unlike traditional reinforcement, these bars are tensioned after the concrete has hardened, applying a compressive force to counteract tensile stresses. This process improves the structure's durability, reduces cracking, and allows for longer spans or thinner concrete sections, making it ideal for bridges, parking structures, high-rise buildings, and other large-scale projects. Post-tensioning bars are typically anchored at both ends and tightened using hydraulic jacks, providing flexibility and efficiency in modern construction.
