## Abstracts

The global Postoperative Nausea and Vomiting Management market size is predicted to grow from US\$ 1410 million in 2025 to US\$ 3226 million in 2032; it is expected to grow at a CAGR of 12.8% from 2026 to 2032.

Postoperative nausea and vomiting (PONV) management refers to the various strategies and interventions used to prevent or treat nausea and vomiting in patients after surgery.

The postoperative nausea and vomiting (PONV) management market is driven by the increasing number of surgical procedures and the growing awareness about the adverse effects of PONV on patients' recovery and satisfaction. Anesthesia-induced nausea and vomiting are common complications after surgery, and effective PONV management is crucial to enhance patient outcomes and reduce healthcare costs associated with extended hospital stays and additional treatments. As a result, there is a rising demand for pharmacological and non-pharmacological interventions, such as antiemetic medications, acupuncture, and enhanced recovery protocols, to prevent and alleviate PONV. However, the market also faces challenges, including the variability in individual patient responses to antiemetic treatments and the risk of adverse effects associated with certain medications. Additionally, the availability and affordability of effective PONV management options in different healthcare settings can vary, especially in resource-limited regions. Overcoming these challenges through ongoing research and innovation in PONV management approaches, personalized patient care, and education of healthcare professionals will be essential in driving the growth of the postoperative nausea and vomiting management market and improving the post-surgical experience for patients worldwide.
