The global Potassium Bromide (KBr) Crystal Substrates market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Potassium bromide single crystal has uniform texture, bright and transparent, has high transparency to infrared, thickness is less than 10mm, transmittance is greater than 90% in the range of 4000-500cm⁻¹, and no impurity absorption.

It is a good conductor of wide band from ultraviolet to middle infrared. Widely used in infrared spectrum analysis and production of ultraviolet, infrared optical components. Potassium bromide single crystal is a material for making optical elements, and can be used as a transparent material for prisms, lenses, filters and various pool Windows and laser Windows in infrared devices and optical instruments. At the same time, potassium bromide crystals are also important film substrate materials, especially for 'film-base' separation applications, such water-soluble substrates can easily dissolve the substrate with water, leaving only the film.
