The global Potassium Hydroxide (KOH) market size is predicted to grow from US\$ 2897 million in 2025 to US\$ 3288 million in 2032; it is expected to grow at a CAGR of 1.9% from 2026 to 2032.

Potassium hydroxide (KOH), also known as caustic potash, is a strong inorganic alkali sold mainly in the form of flakes, pellets, or aqueous solutions. It is typically produced through chlor-alkali electrolysis of potassium chloride brine, with chlorine and hydrogen generated as co-products. KOH is valued for its strong alkalinity, hygroscopicity, saponification ability, pH-adjusting function, dehydration performance, and suitability for electrolyte-related applications. In 2025, global potassium hydroxide (KOH) sales reached approximately 2,711.85 Kilotons. The potassium hydroxide (KOH) value chain starts with potassium chloride, industrial salt, electricity, ion-exchange membrane electrolyzers, and evaporation equipment; the midstream includes brine purification, electrolysis, concentration, flaking or pelletizing, and packaging; and downstream demand mainly comes from potassium-based chemicals, detergents, food and pharmaceuticals, agrochemicals, battery materials, electronic chemicals, and water treatment.

The downstream demand structure for potassium hydroxide (KOH) is undergoing a profound transformation, marked by weak growth in traditional applications and the rapid rise of emerging sectors. Traditional applications, such as soft soap, detergents, food additives, and pharmaceutical intermediates, have entered a stage of stable or even slightly declining demand due to high market maturity, slower population growth, and the emergence of substitutes such as synthetic detergents. As a result, these segments are no longer sufficient to absorb the large amount of newly added capacity. However, the rapid development of the new energy industry has created a new growth

driver for the potassium hydroxide market. With the increasing penetration of electric vehicles worldwide, the indirect demand for high-purity potassium hydroxide from power batteries has grown significantly. Although this segment still accounts for a relatively small share of total capacity in absolute volume terms, its growth rate is much higher than that of traditional industries, and its strict purity requirements allow for relatively higher profit margins. This divergence in demand structure has created a structural imbalance within the market: ordinary industrial-grade potassium hydroxide is facing serious overcapacity and weak prices, while high-purity products such as battery-grade and electronic-grade potassium hydroxide may experience temporary supply tightness.
