Potting is something that gardeners and plant growers need to do periodically for plants nutrition. The soil is one of the essential parts of potting. Thus, for healthy root development of healthy plants, it is important to add good soil. To enrich the soil quality different mixes and additives are added to it. Some potting mix additives often contain amendments including fertilizers and unique moisture-retaining crystals with high nutrients through which plant feed. Over time these nutrients can be drained by plants from the soil. Moreover, by adding a few mix additives to the used soil, it can be used again for potting such as adding perlite to the soil which will help lighten the ground and deliver drainage.
