The global Powder Coating for Electrostatic Spray market size is predicted to grow from US\$ 1321 million in 2025 to US\$ 1947 million in 2032; it is expected to grow at a CAGR of 5.8% from 2026 to 2032.

Electrostatic spraying of powder coatings is a technique used for surface treatment that utilises the principle of electrostatic force to apply the powder coating uniformly to the surface of the workpiece, after which the powder is heated to melt and form a solid coating. This technique is commonly used for metal surfaces, but with advances in technology and materials, it can now be applied to non-metallic surfaces as well. Compared to traditional liquid paints, powder coatings contain virtually no volatile organic compounds (VOCs), reducing environmental pollution.

Powder coatings lack solvents, giving way to negligible volatile organic compound (VOC) emission into the atmosphere and reducing the risk of combustion during their usage and storage process. In addition, the powder can be easily washed when exposed to human skin, which reduces the risk of health problems for operators. ETFE is excellent in processability and able to form a thick and non-stick film layer with electrical, mechanical and chemical strength. FEP and PFA Coating Powder are low in melt viscosity and excellent in melt fluidity which can give a coating free of pinholes.
