Powder metallurgy is the process of making metal powder or using metal powder (or a mixture of metal powder and nonmetal powder) as raw material, forming and sintering, making metal materials, composite materials and various types of products. Powder metallurgy is similar to the production of ceramics in that both of them belong to powder sintering technology. Therefore, a series of new powder metallurgy technologies can also be used in the preparation of ceramic materials. Because of the advantages of powder metallurgy technology, it has become the key to solve the problem of new materials and plays an important role in the development of new materials. Powdered metal parts are parts made from powdered metal via powder metallurgy. Manufacturers turn to powder metallurgy in order to cost-effectively fabricate precision parts. With powder metallurgy, they can carefully control elements like porosity, shape and design. Powdered metal parts offer some of the tightest tolerances on the market.
