The Powder Pneumatic Conveying System is a device system that utilizes gas energy to transport powder materials. It mainly consists of an air supply unit, a conveying pipeline, a feeder, a separator, and a control device. The air supply unit generates airflow with a certain pressure and flow rate. The feeder introduces powder materials into the airflow, forming a gas-solid two-phase flow. The powder is carried by the airflow through the conveying pipeline. Upon reaching the destination, the separator separates the powder from the gas, while the control device adjusts parameters and monitors the entire conveying process to ensure stable and efficient operation.
