The global Powder Wood Activated Carbon market size is predicted to grow from US\$ 1128 million in 2025 to US\$ 1575 million in 2032; it is expected to grow at a CAGR of 4.9% from 2026 to 2032.

Powder wood activated carbon is a powdery porous adsorbent material made mainly from wood biomass such as sawdust, wood chips, sawdust, fruit wood, bamboo wood mixture, etc., through processes such as carbonization, activation, acid washing, water washing, drying, crushing, and grading. Common activation routes include phosphoric acid method, zinc chloride method, and steam activation method. This product has the characteristics of developed pore structure, large specific surface area, fast adsorption speed, strong decolorization ability, low ash content, and high liquid-phase purification efficiency. It is mainly used in the fields of food and beverage decolorization, sugar refining, alcohol purification, oil decolorization, pharmaceutical refining, raw material and intermediate purification, dye and pigment decolorization, chemical waste liquid treatment, drinking water purification, sewage deep treatment, flue gas adsorption, and catalyst carrier. Compared with granular wood activated carbon, powdered wood activated carbon has finer particle size, larger contact area, and faster adsorption reaction rate, making it more suitable for one-time addition, intermittent adsorption, liquid-phase decolorization, and short process purification processes. In 2025, global Powder Wood Activated Carbon production reached approximately 481 K MT, with an average global market price of around US\$ 2,397 per MT.

Powder wood activated carbon belongs to the subdivision products in the activated carbon industry that lean towards liquid-phase decolorization and fine purification. The demand mainly comes from fields such as food and beverage, pharmaceuticals, fine chemicals, water treatment, environmental protection, and industrial waste liquid

purification. Around 2025, food processing and pharmaceutical chemical customers' requirements for low ash content, low heavy metals, high decolorization power, low impurities, and batch stability will increase, driving the demand for high-quality powdered wood activated carbon to maintain growth; At the same time, industrial wastewater upgrading, advanced sewage treatment, emergency purification of drinking water, adsorption of flue gas pollutants, and refining of chemical products also provide continuous application space for powdered wood activated carbon. In terms of industry competition, there is a large supply of ordinary industrial grade products, and their prices are significantly affected by wood raw materials, phosphoric acid, zinc chloride, energy, environmental treatment, and transportation costs, with relatively limited profit margins; Food grade, pharmaceutical grade, and high-purity low ash products have higher added value, and enterprises need to form advantages in raw material screening, pore size control, acid washing and purification, heavy metal control, dust control, customized adsorption performance, and quality certification. Future opportunities will mainly focus on high-end food decolorization, raw material refining, fine chemical purification, emergency dosing in urban water plants, deep treatment of industrial wastewater, and utilization of green biomass resources. Enterprises with stable raw material bases, environmentally compliant production, rapid delivery, and application testing service capabilities are more likely to obtain long-term customer orders.
