Power battery cathode material refers to the active material on the battery cathode, which is mainly composed of cobalt, nickel, manganese, iron and other metal oxides mixed together. In the process of charging and discharging lithium-ion batteries, the cathode material plays a vital role. During charging, the lithium ions generated by the positive electrode move across the separator to the negative electrode through the electrolyte; when discharging, the embedded lithium ions escape and move back to the positive electrode. Therefore, the performance of the cathode material directly affects the charging capacity, discharge capacity, energy density, cycle life and safety performance of the battery.

At present, power battery cathode materials mainly include lithium cobalt oxide, lithium manganate, lithium iron phosphate, lithium iron phosphate, ternary materials, etc.

The global Power Battery Cathode Material market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
