A contactor is an electromechanical switch whose function is to make or break the connection between the power supply and the load. The contactor is electrically controlled and usually powered at a much lower level than the switched circuit. There are various types of contactors, and each type has its own set of features, capabilities, and applications. Contactors can break current over a wide range of currents, from a few amperes to thousands of amperes, and voltages from 24 VDC to thousands of volts. The most common application area of the contactor is high-current load. The contactors cannot be used on their own as circuit protection elements but when used together with thermal relays they protect the circuit against excessive current loads.
