The global Power Domain Controller market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The power domain controller is a key electronic control unit that integrates vehicle power system management. It is mainly used to optimize and coordinate the working status of the vehicle's internal combustion engine, transmission, motor, battery and other powertrain components. Through advanced control algorithms and real-time data processing, the power domain controller can improve the vehicle's overall performance, fuel economy and emission standards, and enhance the driving experience. It realizes the energy management of the engine and motor, ensures smooth switching under different driving modes, optimizes the coordinated work of the engine and transmission, and improves energy efficiency. At the same time, the power domain controller can also integrate an energy recovery system to convert kinetic energy into electrical energy and store it in the battery during braking and deceleration, further improving the vehicle's endurance and environmental performance.
