The report requires updating with new data and is sent in 48 hours after order is placed.

As the human machine interface machines are increasing globally there have been an increasing demand for the integration of compact and efficient parts, one of those parts is the power MOSFET. Power MOSFETs has a vertical structure in which source and drain terminals are at opposite sides of the chip. The vertical structure of the power MOSFET is used to eliminate crowding at the gate and it help in large channel width. Also, thousands of these transistor cells are put together on one to handle the high currents & voltage required.
