## Abstracts

The global Power and Propulsion Control System market size is predicted to grow from US\$ 152 million in 2025 to US\$ 242 million in 2032; it is expected to grow at a CAGR of 7.0% from 2026 to 2032.

In 2025, the number of new Power and Propulsion Control Systems installed in global new shipbuilding and major conversion projects was approximately 9,470 units. Based on the number of propulsion control systems per ship, the average price per system was approximately USD 16,400, with a gross profit margin of approximately 24%–32%. A typical system structure includes a bridge propulsion control console (including single/dual control handles, mode selection and emergency stop buttons), an engine room propulsion control unit (including PLC or dedicated controller, redundant power supply, I/O modules), actuator modules connected to the main engine/gearbox/ CPP or electric propulsion inverter, propulsion system sensors (speed, torque, oil pressure, oil temperature, pitch feedback), communication networks (CAN, redundant Ethernet, serial bus), and alarm/event logging software. In terms of parameters, a typical system supports 1–4 main propulsion units (main engine + gearbox + propeller or motor + gearbox + propeller). Control modes include in-port/offshore/DP/towing/emergency modes. Communication interfaces support MODBUS, CAN, NMEA 2000, redundant Ethernet, etc. The system is designed for an ambient temperature of -15 to +55 °C, and its vibration resistance meets the requirements of classification societies. Power supplies are mostly 24 V DC + 230/400 V AC with redundancy. In terms of typical usage, a small offshore workboat/tugboat is usually equipped with one single-engine propulsion control system; a PSV/OSV with twin engines, twin propellers, and bow thrusters is usually equipped with one integrated propulsion control system + DP interface; medium and large bulk carriers, tankers, and container ships are mostly equipped with one main propulsion control system + shut-off box/emergency control

device; and offshore engineering vessels, ferries, and high-end yachts often have their original mechanical or hybrid control systems converted to fully electronic propulsion control systems during retrofitting/upgrading.
