According to our LPI (LP Information) latest study, the global Power Rectifiers market size was valued at US\$ million in 2023. With growing demand in downstream market, the Power Rectifiers is forecast to a readjusted size of US\$ million by 2030 with a CAGR of % during review period.

The research report highlights the growth potential of the global Power Rectifiers market. Power Rectifiers are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Power Rectifiers. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Power Rectifiers market.

Power rectifiers are devices that convert AC power to DC power. They can be used to power devices and detect radio signals. Rectifiers can be made of vacuum tubes, pilot tubes, solid-state silicon semiconductor diodes, mercury arcs, etc. In contrast, a device that converts DC power to AC power is called an 'inverter'

In the standby UPS, only the battery needs to be charged, and the load does not need to be powered, so there is only a charger. In a double-conversion UPS, this device not only supplies power to the inverter but also charges the battery, so it is called a rectifier / charger.

A rectifier is a rectifying device. In short, it is a device that converts alternating current (AC) into direct current (DC). It has two main functions: first, it converts alternating current (AC) into direct current (DC), and supplies it to the load after filtering, or to the

inverter; Therefore, it also functions as a charger.
