## **Abstracts**

The global Power Semiconductor Electron Beam Irradiation market size is predicted to grow from US\$ 186 million in 2025 to US\$ 354 million in 2032; it is expected to grow at a CAGR of 9.1% from 2026 to 2032.

Power semiconductor electron beam irradiation refers to an industrial contract service that uses a high-energy electron beam (E-beam) to modify, test, or optimize the performance of power semiconductor devices, including IGBTs, MOSFETs, diodes, thyristors, and novel wide-bandgap devices such as SiC and GaN. This process enables precise defect control, minority carrier lifetime adjustment, and switching characteristic optimization. Electron beam processing is performed under controlled conditions, including single-sided or double-sided irradiation, and the electron beam energy can be adjusted according to device requirements to meet the electrical and thermal performance requirements of power devices. The global gross margin for power semiconductor electron beam irradiation is projected to be approximately 36%-66.51% in 2025.

The global power semiconductor electron beam processing service market continues to expand due to growing demand from new energy vehicles, renewable energy inverters, industrial automation, and high-power modules in aerospace. Core listed companies dominate the market, providing high-energy electron beam facilities and customized processes, while long-tail companies supplement regional needs, achieving overall global market coverage.

Technically, E-beam is the only mainstream industrial processing technology, offering adjustable energy and combining single-sided or double-sided processes to meet the

requirements of different device package thicknesses and power ratings. Through precise defect control and performance optimization, services significantly improve the switching performance, thermoelectric performance, and reliability of devices, creating value for downstream customers.

Regional supply chain distribution shows that the US, Europe, Japan, and South Korea are the main markets, while the Chinese and Taiwanese markets are expanding rapidly, and the Southeast Asian and Indian markets are in the development stage. Market concentration is high, with core companies contributing approximately 70-75% of revenue and long-tail companies contributing approximately 25-30%, ensuring overall service capabilities and flexibility.

Market growth is driven by downstream demand, including electric vehicle power inverters, industrial power control modules, and aerospace power devices. Policy support, new product launches, capacity expansion investments, and cross-regional supply chain migrations all have a positive impact on future growth trends.

The future market still faces challenges such as high equipment investment, stringent quality control, and capacity limitations. However, with the maturation of industry technology and increasing customer demand for reliability, the potential for high-end customized electron beam processing services continues to grow.
