## Abstracts

The global Power Skiving Tools market size is predicted to grow from US\$ 257 million in 2025 to US\$ 448 million in 2032; it is expected to grow at a CAGR of 8.4% from 2026 to 2032.

In 2024, the global installed base of Power Skiving Tool was approximately 965 units, with an average unit price of approximately USD 253,000 and a gross profit margin of approximately 28%–36%. High-performance gear cutting tools typically consist of a high-performance substrate (powder metallurgy high-speed steel or ultrafine-grained cemented carbide), multi-layer nano-PVD coating (such as TiAlN, AlCrN, TiCN), helical tooth-shaped cutting edges, internal cooling channels, and a high-precision tapered shank/spline connection structure. Typical parameters include a module range of  $m=0.5-6$  (up to  $m=10$  in the high-end), an outer diameter of 50–250 mm, a number of teeth of 10–80, a substrate hardness of 62–68 HRC, a coating hardness of 2,800–3,500 HV, a suitable gear hardness of 30–62 HRC, a recommended cutting speed of 120–350 m/min, a cross angle of 15–35°, and a regrinding capacity of 5–10 times.

Market growth is driven by multiple factors: On the one hand, the global automotive industry, particularly electric drive systems and high-efficiency automatic transmissions, is rapidly increasing its demand for high-precision, high-efficiency gear machining, prompting OEMs and Tier 1 and Tier 2 gear suppliers to actively migrate from gear shaping/broaching to Power Skiving processes. On the other hand, the increasing demand for flexibility in machining internal gear rings and complex tooth profiles in fields such as construction machinery, robot joint reducers, wind power, and industrial reducers makes 'one composite machine tool + one Power Skiving Cutter' a typical solution to replace multiple processes and specialized machine groups, thereby amplifying the value of a single tool kit. The upgrading of machine tools towards higher rigidity, higher torque, and higher dynamic response also provides a foundation for high linear speed skiving processes. In terms of limiting factors, the initial investment

threshold for Power Skiving Cutter and its supporting machine tools is relatively high, the skill requirements for process engineers and operators are high, and it is sensitive to workpiece clamping and machine tool rigidity. These factors limit its rapid adoption among low-volume, small-factory users. At the same time, price fluctuations in high-performance substrate materials and coated sputtering targets will put periodic pressure on tool gross margins. Overall, driven by the trends of automotive electrification, lightweight transmission systems, replacement of high-efficiency gear machining processes, and intelligent manufacturing, the Power Skiving Cutter market is characterized by 'high concentration of leading machine tool/tool ??manufacturers + concentrated bidding by OEMs and large gear companies driving large projects + continuous increase in the usage and value of single-line tools + slow but continuous replacement of traditional process share.' It is expected that in the next few years, it will maintain a state of medium-to-high-speed growth and high technical barriers.
