The global PP Random Copolymer market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

PP Random Copolymer is a polypropylene material formed by random copolymerization of propylene and a small amount of ethylene in the molecular chain. This structure gives the material higher flexibility, transparency and impact resistance, while maintaining the excellent mechanical properties and chemical stability of polypropylene. Compared with PP homopolymer, PP random copolymer has a lower melting point and better processing performance, so it can improve the toughness and surface finish of the product during processing. It is widely used in the manufacture of transparent packaging, pipes, injection molded products, etc., especially in applications that require both transparency and toughness.

United States market for PP Random Copolymer is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for PP Random Copolymer is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
