The global PPC Resin for Packaging market size is predicted to grow from US\$ 48.91 million in 2025 to US\$ 147 million in 2032; it is expected to grow at a CAGR of 16.6% from 2026 to 2032.

PPC Resin for Packaging, more rigorously expressed as poly(propylene carbonate) resin for packaging, is an aliphatic thermoplastic polycarbonate produced through the catalytic copolymerization of carbon dioxide and propylene oxide. It is typically supplied in the form of resin pellets, films, solutions, or dispersions, and is generally a clear or translucent solid. The material combines flexibility, transparency, oxygen-barrier performance, and biodegradation potential, making it suitable for barrier films, degradable packaging bags, single-use film materials, and functional layers in multilayer packaging structures. Its commercial pathway is not based on broad replacement of mainstream polyolefins, but rather on penetration into packaging segments that value barrier performance, downgauging, biodegradability, or low-temperature packaging functionality. At the same time, because its thermal stability, heat resistance, and dimensional stability remain limited, real packaging applications usually depend on blending, modification, or multilayer structural design.

In 2025, global production of packaging-grade PPC resin reached approximately 12,000-18,000 metric tons, while mainstream ex-works or FOB-equivalent prices were generally in the range of USD 2,700-3,300 per ton.
