Pre-charged relays are relays that can control the switching state of the circuit according to the circuit control signal input. They are especially used to protect capacitors and controllers in high-voltage circuits, and to achieve stable and safe capacitor charging by limiting the current during the capacitor pre-charging process. The main function of the pre-charged relay is to protect capacitors and controllers, reduce surge currents on the circuit, and extend the service life of the circuit. In high-voltage circuits such as electric vehicles and solar energy, the voltage of capacitors is usually very high. Once the capacitor is connected, a large transient current will occur in the circuit, which will cause great damage to the capacitor and controller, and even cause fire hazards. Pre-charge relays effectively avoid this situation by limiting the current.

The global Pre-charge Relay market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
