The global Prebiotics for Infant Formula market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

Prebiotics for infant formula refer to specific types of carbohydrates that are added to infant formula to promote the growth and activity of beneficial bacteria in the baby's digestive system. These prebiotics serve as a food source for the beneficial bacteria, known as probiotics, which are naturally present in the infant's gut or are introduced through the formula. By supporting the growth of these beneficial bacteria, prebiotics help create a favorable environment in the infant's digestive tract, which can have several potential health benefits.

Prebiotics used in infant formula are typically derived from either human milk or plant sources. The most commonly used prebiotics in infant formula include oligosaccharides such as galacto-oligosaccharides (GOS) and fructo-oligosaccharides (FOS). These prebiotics are structurally similar to the oligosaccharides found in human breast milk, which are known to have important roles in supporting the development of a healthy gut microbiome in infants.

The addition of prebiotics to infant formula aims to mimic the beneficial effects of breastfeeding on the infant's gut health. Research suggests that prebiotics in infant formula can help establish a more balanced and diverse gut microbiota, which may support the development of a healthy immune system, improve digestion, and potentially reduce the risk of certain health conditions, such as allergies and infections.

It's important to note that prebiotics should not be confused with probiotics, which are

live bacteria or yeasts that are also sometimes added to infant formula. Prebiotics act as a food source for probiotics, while probiotics themselves are the beneficial live bacteria that can provide direct health benefits when consumed.
