Semiconductor chamber parts cleaning lagged behind the 'Ultra-Clean Revolution' which is central in discussing all other semiconductor process inputs (i.e., gases, chemicals and silicon). Every other semiconductor process input has a Certificate of Analysis (COA) even new parts. However, recycled chamber part cleanliness varies significantly in particle levels and atomic level contamination. This is partly because standard practice used the tools themselves to perform the final cleaning of the parts. Verifying cleanliness targets was achieved by using many test wafers, expensive wafer metrology and wasted production time. Cleaning is a process to remove contaminants such as particles and ionic impurities of equipment parts generated during customers' process.

The global Precision Cleaning for Lithography Equipment Parts market size is projected to grow from US\$ 61.5 million in 2024 to US\$ 95.7 million in 2030; it is expected to grow at a CAGR of 7.7% from 2024 to 2030.
