Precoat Filter consists of a layer of fine but permeable material laid down on a mesh or media and then act as a depth medium for fine particle. The coarser particle may form a cake on the precoat. Precoat filters are used for the fine filtration of cooling lubricants (oil) during finishing and honing as well as for the filtration of other oils and baths with especially high purity standards. For a consistently high production quality and surface quality of the processed workpieces, the correct filtration of the cooling lubricants, oils and baths is very important.
