The global Precursors for Semiconductor market size is predicted to grow from US\$ 2088 million in 2025 to US\$ 4077 million in 2032; it is expected to grow at a CAGR of 9.5% from 2026 to 2032.

Precursors for Semiconductor is the core manufacturing material of semiconductor thin film deposition process. It has high barriers and high growth. It is used in semiconductor production and manufacturing process to carry target elements, gaseous or volatile liquid, with chemical and thermal stability, and corresponding reactivity or physical properties. a class of substances. In the semiconductor manufacturing process including thin film, lithography, interconnection, doping technology, etc., the precursor is mainly used in vapor deposition (including physical deposition PVD, chemical vapor deposition CVD and atomic vapor deposition ALD) to form semiconductor manufacturing requirements various thin film layers. In addition, the precursor can also be used for semiconductor epitaxial growth, etching, ion implantation doping and cleaning, etc., and is one of the core materials for semiconductor manufacturing.

Precursors for semiconductor are core manufacturing materials for semiconductor thin-film deposition processes, featuring high technical barriers and strong market growth potential. Characterized by containing target elements, existing in gaseous or volatile liquid states, these materials must simultaneously meet stringent requirements for chemical thermal stability, specific reactivity, and physical properties.

In semiconductor manufacturing processes, the applications of precursors span key procedures such as thin-film deposition, photolithography, interconnection, and doping. They play a pivotal role particularly in vapor deposition technologies, including Physical Vapor Deposition (PVD), Chemical Vapor Deposition (CVD), and Atomic Layer

Deposition (ALD), enabling the fabrication of various functional thin-film layers that comply with semiconductor production standards. Beyond this, their application scope extends to epitaxial growth, etching, ion implantation doping, and wafer cleaning, making them one of the core materials supporting semiconductor manufacturing.

With the escalating downstream demand for higher speed and larger capacity of storage products, high-capacity storage technology has emerged as a mainstream trend in the industry. In recent years, domestic memory chip manufacturers such as Yangtze Memory Technologies Co., Ltd. (YMTC), ChangXin Memory Technologies (CXMT), and GigaDevice Semiconductor Inc. have experienced rapid development, steadily increasing their market share on a global scale. This trend has directly driven the growth of demand for semiconductor precursors in the Chinese market.
