Predictive Ship Maintenance is a data-driven advanced maintenance strategy designed to perform repairs at the optimal time by monitoring the real-time status of ship equipment and predicting potential failures. This system leverages IoT sensors, big data analytics, and machine learning algorithms to continuously collect and analyze operational data such as vibration, temperature, and pressure from critical equipment like main engines, auxiliary engines, and propulsion systems. By identifying abnormal patterns and comparing them with historical failure data, the system can accurately predict remaining service life and issue early warnings. Compared to traditional scheduled maintenance, this approach effectively reduces the risk of unplanned downtime, lowers spare parts replacement costs, extends equipment life, and significantly improves the safety and economy of ship operations.
