The global Prefabricated Panelized System Building market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Prefabricated Panelized System Building, also known as panelized construction or panelized building systems, refers to a construction method that involves the use of factory-built panels or modules that are assembled on-site to create a building structure. In this system, the building components such as walls, floors, and roofs are manufactured off-site in a controlled factory environment. These components, typically large panels or modules, are then transported to the construction site and assembled to form the building structure. The panels are usually made of materials such as wood, steel, or concrete and can be customized according to the design and specifications of the building. Prefabricated panelized system building offers several advantages over traditional on-site construction methods. It allows for faster construction time as the components are prefabricated in a factory setting, reducing on-site labor and construction time. Additionally, the controlled factory environment ensures better quality control and precision in the manufacturing process. Moreover, this construction method is often more efficient in terms of materials usage and waste reduction. It also offers flexibility in design and can accommodate various architectural styles and building types.
