Preformulation analysis service refers to a range of scientific and analytical techniques used to evaluate the physical, chemical, and biopharmaceutical properties of a drug substance or active pharmaceutical ingredient (API) before it is formulated into a dosage form.

The purpose of preformulation analysis is to understand the characteristics and behavior of the drug substance, which can help in the development of an effective and stable formulation. It involves studying various parameters such as solubility, stability, particle size, polymorphism, pH-solubility profile, and compatibility with excipients.

Preformulation analysis services are typically offered by contract research organizations (CROs) or analytical laboratories. These services can provide valuable information to pharmaceutical companies during the early stages of drug development, helping them make informed decisions about formulation strategies, dosage forms, and potential issues that may arise during formulation or manufacturing processes.
