The global Premarital Genetic Testing market size is predicted to grow from US\$ 1488 million in 2025 to US\$ 2141 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

Premarital genetic testing refers to a medical testing service that analyzes the genetic material of both partners before marriage or planned reproduction to assess whether they carry disease-causing gene mutations, chromosomal abnormalities, or related genetic risks that may lead to genetic diseases in their offspring. Its core purpose is to identify carrier status of recessive genetic diseases and reproductive risks in advance, thereby providing a scientific basis for marriage and childbearing decisions. When necessary, it can reduce the risk of birth defects through genetic counseling, assisted reproductive technology, or prenatal diagnosis, and is an important component of preventive medicine and reproductive health management.

The premarital genetic testing industry has continued growth potential, primarily driven by factors including increased global awareness of birth defect prevention, the promotion of eugenic policies, decreasing costs of genetic testing, and the maturity of precision medicine technologies. With the widespread adoption of NGS technology, the scope of testing has gradually expanded from single-gene diseases to chromosomal abnormalities and polygenic risk assessment, continuously improving the accuracy and coverage of testing. Meanwhile, in emerging markets with large populations such as China, India, and the Middle East, government emphasis on birth defect prevention is accelerating the popularization of this type of testing. In the future, the industry will further develop towards an integrated service model of 'testing + genetic counseling + reproductive assisted decision-making', and gradually integrate into hospitals, physical examination centers and consumer-level health management platforms. There is still

considerable room for improvement in market penetration.
