Premature ovarian failure (POF, also called primary ovarian insufficiency or early menopause) is a common gynecological endocrine disease characterized by the loss of ovarian function in women below 40 years. Most often, it is a non-reversible pathology leading to infertility. Normally, ovaries produce hormones and eggs until the early fifties, when they stop working and most women enter menopause. However, phenomena such as the dysfunction and the depletion of follicles (the cellular aggregates in the ovaries secreting hormones that influence the menstrual cycle) lead to POF, whose prevalence is 1/250 in women under 35 years and 1/100 in women under 40 years; the consequent loss of ovarian reserve (the number of follicles remaining in a woman's ovaries) increases the risk of infertility, severely affecting women both physically and

mentally.

Pfizer and Bayer are the top two manufacturers of premature ovarian failure cure globally and account for over 30% of global market share in total.
