The global Premium ALD Equipment market size is predicted to grow from US\$ 2145 million in 2025 to US\$ 3398 million in 2031; it is expected to grow at a CAGR of 8.0% from 2025 to 2031.

Atomic layer deposition (ALD) is a method of depositing substances layer by layer on a substrate surface in the form of a single atomic film. Atomic layer deposition has similarities with ordinary chemical deposition. But in the process of atomic layer deposition, the chemical reaction of the new layer of atomic film is directly related to the previous layer, which causes only one layer of atoms to be deposited in each reaction. The ALD process can more accurately control the size of thin films, which is becoming increasingly important in DRAM, 3D NAND, and logical FinFET manufacturing and may become the core process for future thin film deposition.

ALD technology is a method of depositing substances layer by layer on the surface of a substrate in the form of a single atomic film, which can achieve the deposition of ultra-thin films at the nanoscale. At present, ALD technology can be subdivided into TALD, PEALD, SALD, etc. The types of thin films prepared include oxides, nitrogen (carbon) compounds, metal and non-metal elements, covering dielectric layers, conductors, and semiconductors. The self confinement and wide window temperature characteristics of ALD reaction make the grown thin films have advantages such as good step coverage, large-area uniformity, density without pores, and deposition parameters such as thickness are easy to accurately control. ALD technology is particularly suitable for thin film deposition on complex morphology and high aspect ratio trench surfaces, and is widely used in advanced semiconductor processes such as High-K gate dielectric

layers, metal gates, and copper diffusion barriers. In 2020, the global ALD equipment market accounted for approximately 11% of the overall market for thin film deposition equipment. From the perspective of equipment investment composition in wafer fabs, the investment in thin film deposition equipment accounts for approximately 25% of the total investment in wafer manufacturing equipment. With the accelerated construction and expansion of global and domestic wafer fabs, as well as the evolution of semiconductor device structures towards finer details, the ALD equipment market has vast potential.
