The global Preparative Chromatography System for Biopharmaceuticals market size is predicted to grow from US\$ 3114 million in 2025 to US\$ 5167 million in 2032; it is expected to grow at a CAGR of 7.4% from 2026 to 2032.

In 2025, global production of Preparative Chromatography System for Biopharmaceuticals reached 18,700 units, with an average price of \$170,000 per unit and an industry gross margin of 28%. Preparative chromatography systems are one of the core equipment in downstream separation and purification processes. They primarily utilize the selectivity differences between target components and stationary or mobile phases to achieve the separation, enrichment, and purification of target products in complex fermentation broths, cell culture media, or reaction systems. Based on the chromatographic target and process mode, common systems include small molecule preparative chromatography systems, macromolecular protein purification chromatography systems, single-use chromatography systems, and continuous chromatography systems. Small molecule chromatography systems are mostly used for the purification of peptides, antibiotics, natural products, small molecule drug intermediates, and some fermentation metabolites, typically focusing on resolution, sample loading capacity, solvent compatibility, and stable operation under high pressure. Macromolecular chromatography systems are mainly designed for biomolecules such as proteins, monoclonal antibodies, recombinant proteins, plasma proteins, vaccine antigens, enzymes, nucleic acids, and viral vectors, emphasizing gentle separation, preservation of biological activity, online UV/conductivity/pH/pressure monitoring, low-shear flow paths, and GMP compliance. Single-use chromatography systems are primarily suitable for multi-product co-production, small-batch high-value products, clinical samples, and novel therapies, reducing the risks of cleaning validation and cross-contamination. Continuous chromatography systems, through multi-column

switching or periodic operation, improve packing material utilization and production efficiency, making them suitable for mature, high-value, and stable-yield products.

From an application perspective, preparative chromatography systems are most mature in biopharmaceuticals, widely used for antibody capture, recombinant protein purification, vaccine drug substance refining, plasma protein separation, peptide purification, antibiotic refining, and nucleic acid-related product purification. In synthetic biology, cosmetics, food additives, and biomaterials, chromatography systems are also increasingly used for the refining of recombinant collagen, functional enzymes, sweeteners, natural active ingredients, fermentation-derived small molecules, and high-purity bio-based intermediates. However, their applications are typically concentrated in high-value-added, high-purity, and complex impurity systems, and they do not completely replace traditional processes such as membrane separation, extraction, crystallization, and evaporation.

United States market for Preparative Chromatography System for Biopharmaceuticals is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
