## Abstracts

The global Pressure-control Silencer market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A pressure-control silencer, also known as a resistance-type muffler, is a device used to reduce noise and vibration generated by gas flow. The device controls the high-speed motion of the gas through a resistance pad composed of plates with a special structure, thereby reducing the noise generated by the gas flow. The main principle is to convert the kinetic energy of the gas flow into pressure energy, and use various methods such as blocking, diffusion, and reflection to restrict and diffuse the gas flow, thereby reducing the production of noise and vibration.

Pressure-control silencer can be widely used in industrial and civil fields, such as air conditioning, ventilation systems, gas turbines, compressors, and other equipment, to reduce the noise and vibration generated during operation, ensuring indoor quietness and the health and safety of operators. At the same time, due to their excellent noise reduction effect and low energy consumption, they are increasingly being used in new energy vehicles, aerospace, and other fields, becoming an important representative of the new generation of environmentally friendly and energy-saving muffler technology.

United States market for Pressure-control Silencer is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
