A pressure feed spray gun is a tool used to apply paint or other coatings to a surface. It is designed to operate by pressurizing the coating material, usually by means of an air compressor, and then forcing it through a spray nozzle onto the surface being painted. The pressure feed spray gun consists of a container, or cup, that holds the coating material. The cup is pressurized, either by a separate pressure source or by the air compressor, and the coating material is then fed through a hose to the spray nozzle. The nozzle is designed to atomize the coating material into a fine mist or spray, which is

then directed onto the surface being painted. Pressure feed spray guns are commonly used in industrial settings and for large surface areas, such as automotive painting or painting large machinery. They are typically more efficient than gravity feed spray guns, as they are able to apply a heavier coat of material more evenly and in less time. However, they also tend to be more costly and require more maintenance than gravity feed spray guns.
