The global Pressure Gas Cooler market size is predicted to grow from US\$ 5870 million in 2025 to US\$ 8308 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

A pressure gas cooler is an industrial heat exchange device specifically designed to reduce the temperature of a pressurized gas medium. Its core working principle involves allowing high-temperature, high-pressure process gas to flow through the shell or tube side, achieving controlled cooling through indirect heat exchange with another cooling medium (typically cooling water, air, or other cryogenic fluids). Demand stems directly from the widespread process requirement of temperature control for compressed or high-pressure gases in modern industry. The upstream supply chain revolves around the manufacturing and supply of high-efficiency heat transfer elements (such as special steel pipes, fins, and plates), pressure-resistant shell materials (carbon steel/stainless steel), seals, and key components such as fans/pumps. Downstream, it is tightly integrated into the process flows of end users such as compressor manufacturers, petrochemical plants, and natural gas processing plants, with engineering companies, complete equipment suppliers, and after-sales service networks serving as hubs. In 2025, the production volume of pressure gas cooler is estimated at approximately 300,000 units, with an average selling price of approximately US\$20,000 per unit, a gross profit margin of approximately 35%, and a single-line capacity of approximately 1500 units per year.

United States market for Pressure Gas Cooler is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
