The global Pressure Injectable PICC Kit market size is predicted to grow from US\$ 392 million in 2025 to US\$ 491 million in 2032; it is expected to grow at a CAGR of 3.3% from 2026 to 2032.

A peripherally inserted central catheter is a peripherally inserted central venous catheter manufactured using medical grade, flexible polyurethane. It is suitable for male and female to use for long-duration. It is used for intravenous therapy, pressure injection, infusion, blood sampling, of contrast media and allows for the central venous pressure monitoring. The kit assists the clinician in maintaining maximal sterile barrier precautions. Wherever there are device-related infections or thrombosis in the intended injection vessel or catheter route, the Pressure Injectable PICC is contraindicated. To ensure there are no contraindications, a clinical assessment of the patient must be performed.

Chronic diseases such as cancer, cardiovascular diseases, and infectious diseases often require long-term intravenous therapy and frequent administration of medications. Pressure Injectable PICC (Peripherally Inserted Central Catheter) kits are commonly used for such purposes, providing a reliable and convenient pathway for medication administration and blood sampling. The growing prevalence of chronic diseases worldwide is driving the demand for Pressure Injectable PICC kits. Pressure Injectable PICC kits offer several advantages over traditional intravenous access devices, such as peripheral IV catheters and central venous catheters. These include longer dwell time, reduced risk of complications, improved patient comfort, and better cost-effectiveness. As healthcare providers recognize the benefits of Pressure Injectable PICC kits, there is an increasing adoption of these devices, contributing to market growth. The global population of older adults is increasing, leading to a higher incidence of chronic

diseases and age-related conditions that require long-term intravenous therapy. Pressure Injectable PICC kits are commonly used in geriatric care settings due to their ease of use and long-term access capabilities. The growing elderly population is a significant driver for the market, as it fuels the demand for Pressure Injectable PICC kits. There is a growing trend towards home healthcare, driven by factors such as cost-effectiveness, convenience, and the desire for patient-centered care. Pressure Injectable PICC kits are well-suited for home healthcare settings, allowing patients to receive intravenous therapy or medication administration in the comfort of their own homes. The increasing focus on home healthcare is contributing to the demand for Pressure Injectable PICC kits. Manufacturers are continually developing and improving the design of Pressure Injectable PICC kits to enhance their performance and patient safety. This includes features such as antimicrobial coatings, improved catheter materials, and integrated pressure injectable ports. Technological advancements in catheter design are driving the market as healthcare providers seek more reliable and advanced devices for intravenous access. Increasing awareness regarding the benefits of Pressure Injectable PICC kits and training programs for healthcare professionals in their use and maintenance are driving market growth. Recognizing the importance of proper catheter selection and insertion techniques, healthcare facilities are investing in training programs to ensure safe and effective use of Pressure Injectable PICC kits. Reimbursement policies and coverage for Pressure Injectable PICC kits vary across different regions. However, there is an increasing trend towards favorable reimbursement policies for intravenous therapy and related devices. This encourages healthcare providers and facilities to adopt Pressure Injectable PICC kits, further driving market growth.
